

Sprint Planning

Sprint 1: Data & Logic Foundation

Sprint Goal

Develop the core logic required to identify demand patterns and calculate earnings efficiency

Tasks

- Analyze ride distribution and demand patterns
- Define logic for identifying high-demand zones
- Build earnings per hour calculation model
- Structure backend data pipeline

Deliverables

- Demand zone identification logic
- Earnings estimation framework

Success Criteria

- Ability to compute rides/hour and earnings/hour accurately
 - Identification of high vs low demand zones
-

Sprint 2: MVP Development

Sprint Goal

Build and integrate core MVP features into a functional interface

Tasks

- Design and implement demand heatmap UI

- Integrate earnings estimation into driver interface
- Connect backend logic with frontend
- Conduct functional testing

Deliverables

- Working MVP with:
 - Demand heatmap
 - Earnings per hour visibility

Success Criteria

- Drivers can identify high-demand zones
 - Drivers can view estimated earnings per hour
-

Sprint 3: Testing & Optimization

Sprint Goal

Validate usability and improve feature effectiveness

Tasks

- Conduct user testing (simulated driver behavior)
- Identify usability issues (information clarity, overload)
- Optimize UI and responsiveness
- Refine demand and earnings calculations

Deliverables

- Improved and validated MVP
- Optimized user interface

Success Criteria

- Improved driver decision-making

- Increased clarity and usability
-

Metrics & Success Measurement

The effectiveness of the solution will be evaluated using the following key metrics:

Primary Metrics

- **Rides per hour:** Increase from ~1.0 to ~1.47 (+40–45%)
- **Earnings per hour:** Increase from ₹106–₹126 to closer to ₹165 (+25–35%)

Secondary Metrics

- Reduction in driver idle time
 - Increase in ride completion rate
 - Improvement in driver retention (reduced churn)
-

Expected Outcome

By addressing inefficiencies in driver utilization:

- Drivers achieve higher ride frequency
 - Earnings become more consistent and predictable
 - Platform improves supply-demand balance
 - Overall marketplace efficiency increases
-

Execution Summary

The Scrum-based approach ensures that:

- Development is aligned with data-driven insights
- High-impact features are delivered first
- Iterative testing improves product quality

- Measurable improvements are achieved in driver performance
